

DIVE INTO SQL: UNLEASHING DATA INSIGHTS WITH SELECT, WHERE, AND ORDER BY

WHAT IS SQL?

SQL (Structured Query

- Language) is used to manage and query data in databases. It's a critical tool for anyone working with relational databases.

Common SQL databases:

- MySQL, PostgreSQL, SQL Server, etc.

SQL enables you to retrieve,

- manipulate, and organize data efficiently.

In this series, we'll dive deep into:

- SELECT: Retrieving specific data.
- WHERE: Filtering based on conditions.
- ORDER BY: Sorting data by categories.

We Generate following data set to execute the codes we study now

| employee_id | first_name | last_name | department | salary | hire_date |
|-------------|------------|-----------|------------|----------|------------|
| 1 | John | Doe | Sales | 55000.00 | 2020-03-15 |
| 2 | Jane | Smith | HR | 48000.00 | 2019-07-01 |
| 3 | Emily | Davis | IT | 70000.00 | 2021-08-22 |
| 4 | Michael | Brown | Sales | 60000.00 | 2018-09-12 |
| 5 | Sarah | Wilson | IT | 65000.00 | 2020-10-09 |
| NULL | NULL | NULL | NULL | NULL | NULL |

MASTERING THE SELECT STATEMENT

- Pro Tip: Use SELECT * to retrieve all columns.
- SELECT allows you to retrieve specific columns from a table.
- Basic syntax:

```
SELECT    column1,    column2,    ...    FROM  
table_name;
```

- Example Code:

```
SELECT    first_name,    last_name    FROM  
employees;
```

- Explanation: Retrieves the first and last names from the 'employees' table.

| first_name | last_name |
|------------|-----------|
| John | Doe |
| Jane | Smith |
| Emily | Davis |
| Michael | Brown |
| Sarah | Wilson |

RENAMING COLUMNS WITH ALIASES

- Aliases allow you to rename columns for better readability.
- Syntax:

```
SELECT      column_name      AS  
alias_name FROM table_name;
```

- Example Code:

```
SELECT  first_name  AS  "First Name",  
last_name AS  "Last Name"  FROM  
employees;
```

- Explanation: Renames columns in the output.

| First Name | Last Name |
|------------|-----------|
| John | Doe |
| Jane | Smith |
| Emily | Davis |
| Michael | Brown |
| Sarah | Wilson |

ELIMINATING DUPLICATES WITH DISTINCT

- The DISTINCT keyword removes duplicate rows in the result.

- Syntax:

```
SELECT DISTINCT column1 FROM  
table_name;
```

- Example Code:

```
SELECT DISTINCT department FROM  
employees;
```

- Explanation: Retrieves unique departments from the 'employees' table.

| department |
|------------|
| Sales |
| HR |
| IT |

FILTERING ROWS WITH THE WHERE CLAUSE

- The WHERE clause filters rows based on a condition.
- Syntax:

```
SELECT    column1,    column2    FROM  
table_name WHERE condition;
```

- Example Code:

```
SELECT    first_name,    last_name    FROM  
employees WHERE department = 'Sales';
```

- Explanation: Filters for employees in the 'Sales' department.

| first_name | last_name |
|------------|-----------|
| John | Doe |
| Michael | Brown |

COMBINING CONDITIONS WITH AND/OR

- Combine multiple conditions using AND and OR.
- Syntax:

```
SELECT column1, column2 FROM  
table_name WHERE condition1 AND/OR  
condition2;
```

- Example Code:

```
SELECT first_name, last_name  
FROM employees  
WHERE department = 'Sales' AND salary >  
50000;
```

- Explanation: Filters employees in Sales with a salary greater than 50,000.

| first_name | last_name |
|------------|-----------|
| John | Doe |
| Michael | Brown |

ADVANCED FILTERING OPTIONS: IN, BETWEEN

- IN: Matches any value in a list.

```
SELECT * FROM employees WHERE  
department IN ('HR', 'IT');
```

| employee_id | first_name | last_name | department | salary | hire_date |
|-------------|------------|-----------|------------|----------|------------|
| 2 | Jane | Smith | HR | 48000.00 | 2019-07-01 |
| 3 | Emily | Davis | IT | 70000.00 | 2021-08-22 |
| 5 | Sarah | Wilson | IT | 65000.00 | 2020-10-09 |

- BETWEEN: Filters within a range.

```
SELECT * FROM employees WHERE  
hire_date BETWEEN '2020-01-01' AND '2020-  
12-31';
```

| employee_id | first_name | last_name | department | salary | hire_date |
|-------------|------------|-----------|------------|----------|------------|
| 1 | John | Doe | Sales | 55000.00 | 2020-03-15 |
| 5 | Sarah | Wilson | IT | 65000.00 | 2020-10-09 |
| NULL | NULL | NULL | NULL | NULL | NULL |

SORTING RESULTS WITH ORDER BY

- The ORDER BY clause sorts the result set.
- Syntax:

```
SELECT    column1,    column2    FROM  
table_name ORDER BY column_name  
ASC|DESC;
```

- Example Code:

```
SELECT * FROM employees ORDER BY  
last_name ASC; Explanation:
```

- employees sorted by last name in ascending order.

| employee_id | first_name | last_name | department | salary | hire_date |
|-------------|------------|-----------|------------|----------|------------|
| 4 | Michael | Brown | Sales | 60000.00 | 2018-09-12 |
| 3 | Emily | Davis | IT | 70000.00 | 2021-08-22 |
| 1 | John | Doe | Sales | 55000.00 | 2020-03-15 |
| 2 | Jane | Smith | HR | 48000.00 | 2019-07-01 |
| 5 | Sarah | Wilson | IT | 65000.00 | 2020-10-09 |
| NULL | NULL | NULL | NULL | NULL | NULL |

SORTING MULTIPLE COLUMNS

- You can sort by multiple columns.
- Syntax:

```
SELECT    column1,    column2    FROM  
table_name ORDER BY column1 ASC,  
column2 DESC;
```

- Example Code:

```
SELECT * FROM employees ORDER BY  
department ASC, last_name DESC;
```

- Explanation: Retrieves employees sorted first by department (ascending) and then by last name (descending).

| employee_id | first_name | last_name | department | salary | hire_date |
|-------------|------------|-----------|------------|----------|------------|
| 2 | Jane | Smith | HR | 48000.00 | 2019-07-01 |
| 5 | Sarah | Wilson | IT | 65000.00 | 2020-10-09 |
| 3 | Emily | Davis | IT | 70000.00 | 2021-08-22 |
| 1 | John | Doe | Sales | 55000.00 | 2020-03-15 |
| 4 | Michael | Brown | Sales | 60000.00 | 2018-09-12 |
